1. Answer the following questions and fill in your responses in the corresponding boxes on the answer sheet.

(1) Let a and b be an integer part and an decimal fraction of $\sqrt{7}$, respectively. Then the integer part of $\frac{a}{b}$ is [1-1].

(2) Consider a cone with a diameter of 12 and a height of 8. The volume of an inscribed sphere in the cone is [1-2].

(3) 5^{29} is an integer with [1-3] places by assuming that $\log_{10} 2 = 0.3010$.

(4) There is a circle with a radius of 2 where the center is at the origin and a line $3x + 4y - 12 = 0$ in the plane. The minimum distance between a point on the circle and a point on the line is [1-4].

(5) If the series $\{a_k\}$ satisfies that $a_1 = 1, a_2 = 2$, and $a_k - 4a_{k-1} + 3a_{k-2} = 0$ ($k \geq 3$), then $a_k = \frac{1 + \text{[1-5]}}{\text{[1-6]}}$ ($k \geq 1$).

(6) Let $f(x) = ax + b$ be a linear function. If the equation

$$\int_{-m/2}^m f(x) dx = \frac{m(m+1)}{2}$$

holds for any positive m , then $f(x) = \frac{\text{[1-7]}x + \text{[1-8]}}{3}$.

2. Consider a semicircle with a diameter AB where the length is 4, and a point C on the circular arc. Answer the following questions and fill in your responses in the corresponding boxes on the answer sheet.

- (1) The maximum of the area of the triangle ABC is [2-1] .
- (2) If the area of the triangle ABC is a half of the maximum and point C is nearer to point A than point B, then the angle $\angle CAB$ is [2-2] .

3. Consider a function

$$y = \left(x^3 + \frac{1}{x^3}\right) - 6\left(x^2 + \frac{1}{x^2}\right) + 3\left(x + \frac{1}{x}\right)$$

defined in $x > 0$.

(1) Letting $t = x + \frac{1}{x}$ gives

$$y = \boxed{[3-1]} t^3 + \boxed{[3-2]} t^2 + \boxed{[3-3]} t + \boxed{[3-4]} .$$

Here it holds that

$$t = x + \frac{1}{x} \geq \boxed{[3-5]} .$$

(2) When $t = \boxed{[3-6]}$, that is, $x = \boxed{[3-7]}$, y has the minimum value $\boxed{[3-8]}$.
